

Abstract of the Disclosure

The present application discloses a wireless hand held portable security device in
5 the form of a wireless hand held portable biometric device in communication with a
plurality of ubiquitous items for receiving information from, and sending information to
the plurality of ubiquitous items, comprising a processor for selecting at least one item of
the plurality of ubiquitous items and for sending information to the selected item in order
to activate or deactivate or send a programming to the selected item. The level of
10 security and the personalization is achieved by using a fingerprint or a combination of
fingerprints for accessing communication with a selected item.
